Then there are 5 red beads to the left of the break and 6 blue beads to the right. *5+6=11*

J5 // CCC - Finding The Winning Move

The Grade 12s have a lot of extra time on their hands, and they find themselves bored on multiple occasions. In order to combat this, they have decided to make Tic-Tac-Toe a bit more interesting on a 4x4 board.

4 × 4 tic-tac-toe is played on a board with four rows (numbered 0 to 3 from top to bottom) and four columns (numbered 0 to 3 from left to right). There are two players, x and o, who move alternately with x always going first. The game is won by the first player to get four of his or her pieces on the same row, column, or diagonal. If the board is full and neither player has won then the game is a draw.

Assuming that it is x's turn to move, x is said to have a forced win if x can make a move such that no matter what moves o makes for the rest of the game, x can win. This does not necessarily mean that x will win on the very next move, although that is a possibility. It means that x has a winning strategy that will guarantee an eventual victory regardless of what o does.

Your job is to write a program that, given a partially-completed game with x to move next, will determine whether x has a forced win. You can assume that each player has made at least two moves, that the game has not already been won by either player, and that the board is not full.

Input Format

Each test case consists of four lines representing the board; formatting is exactly as shown in the example. The characters used in a board description are the period (representing an empty space), lowercase x, and lowercase o.

Output Format

Output a line containing the (row, column) position of the first forced win for x, or '#####' if there is no forced win. Format the output exactly as shown in the example. For this problem, the first forced win is determined by board position, not the number of moves required for victory. Search for a forced win by examining positions (0, 0), (0, 1), (0, 2), (0, 3), (1, 0), (1, 1), ..., (3, 2), (3, 3), in that order, and output the first forced win you find. In the second test case below, note that x could win immediately by playing at (0, 3) or (2, 0), but playing at (0, 1) will still ensure victory (although it unnecessarily delays it), and position (0, 1) comes first.

Sample Input 1

```
....
.xo.
.ox.
....
```

Sample Output 1

```
#####
```

Sample Input 2

```
o...
.ox.
.xxx
xooo
```

Sample Output 2

(0,1)

Sample Input 3

```
.ooo
xxxo
xox.
....
```

Sample Output 3

(0,0)
